## 1 Modifications to 3.2, Symbols and abbreviations

Add the following symbol "  $\alpha$  " in Table 1 to read:

"  $\alpha, \alpha_1, \alpha_2$  Angles between horizontal line and lines of constant  $N$  in the  $\sigma_a$ - $\sigma_m$ -plane".

Delete the following symbol and description in Table 1:

"  $\mu, \mu_1, \mu_2$  Rises of lines of constant  $N$  in the  $\sigma_a$ - $\sigma_m$ -plane".

## 2 Modifications to 4.4.3, Transformation of the identified stress cycles into cycles with constant mean stress or constant stress ratio

Replace the 1<sup>th</sup> sentence with:

"Fatigue strengths are usually presented for constant mean stresses  $\sigma_m$  (usually  $\sigma_m = 0$ ) or constant stress ratio  $R = \sigma_u / \sigma_u$  (usually  $R = -1$  or  $0$ ).".

Replace the existing Equation (10) with:

$$\sigma_a(R) = \frac{\sigma_{a,i} + \operatorname{tg}\alpha \cdot \sigma_{m,j}}{1 + \operatorname{tg}\alpha \cdot \frac{1+R}{1-R}}$$

".

Replace the existing Equation (11) with:

$$\sigma_a(\sigma_m) = \sigma_{a,i} + \operatorname{tg}\alpha \cdot (\sigma_{m,j} - \sigma_m)$$

".

Replace the existing Equation (12) with:

$$\operatorname{tg}\alpha = \operatorname{tg}\alpha_1 = \frac{\sigma_a(R=-1)}{\sigma_a(R=0)} - 1$$

".

*Replace the existing Equation (13) with:*

$$\operatorname{tg} \alpha = \operatorname{tg} \alpha_2 = 1 - \frac{\sigma_a(R = -1)}{\sigma_a(R = \infty)}$$

".

*Replace the meaning of the equation with:*

"where

- $\sigma_{a,i}$  is the stress amplitude of range  $i$  resulting from "rainflow counting" (see Figure 6);
- $\sigma_{m,j}$  is the mean stress of range  $j$  resulting from "rainflow counting" (see Figure 6);
- $\sigma_a(R)$  is the transformed stress amplitude for constant stress ratio;
- $\sigma_a(\sigma_m)$  is the transformed stress amplitude for constant mean stress;
- $R$  is the constant stress ratio selected for one-parameter classification of stress cycles;
- $\sigma_m$  is the constant mean stress selected for one-parameter classification of stress cycles;
- $\alpha_1, \alpha_2$  are the angles between the horizontal line and the lines of constant  $N$  in the  $\sigma_a$ - $\sigma_m$ -plane (see Figures 7 and 8),

NOTE If the mean stress  $\sigma_m$  is assumed not to be decisive (e.g. for welded structures),  $\alpha_1 = \alpha_2 = 0$ .

- $N$  is the number of stress cycles to failure by fatigue for the stress cycle described by  $\sigma_{a,i}$  and  $\sigma_{m,j}$ ;
- $\sigma_a(R = -1)$ ,
- $\sigma_a(R = 0)$ ,
- $\sigma_a(R = \infty)$  are the stress amplitudes, in dependence on the specified stress ratio  $R$  and number of cycles  $N$ , for which failure by fatigue occurs.".

*Replace the sentence above Figure 7 with:*

"The relationship between stress amplitudes to failure by fatigue and mean stress or stress ratio for the component under consideration for fatigue assessment is shown in Figure 7.".
