About the IEC

The International Electrotechnical Commission (IEC) is the leading global organization that prepares and publishes International Standards for all electrical, electronic and related technologies.

About IEC publications

The technical content of IEC publications is kept under constant review by the IEC. Please make sure that you have the latest edition, a corrigendum or an amendment might have been published.

IEC publications search - webstore.iec.ch/advsearchform

The advanced search enables to find IEC publications by a variety of criteria (reference number, text, technical committee,...). It also gives information on projects, replaced and withdrawn publications.

IEC Just Published - webstore.iec.ch/justpublished

Stay up to date on all new IEC publications. Just Published details all new publications released. Available online and once a month by email.

IEC Customer Service Centre - webstore.iec.ch/csc

If you wish to give us your feedback on this publication or need further assistance, please contact the Customer Service Centre: sales@iec.ch.

Electropedia - www.electropedia.org

The world's leading online dictionary on electrotechnology, containing more than 22 000 terminological entries in English and French, with equivalent terms in 16 additional languages. Also known as the International Electrotechnical Vocabulary (IEV) online.

IEC Glossary - std.iec.ch/glossary

67 000 electrotechnical terminology entries in English and French extracted from the Terms and Definitions clause of IEC publications issued since 2002. Some entries have been collected from earlier publications of IEC TC 37, 77, 86 and CISPR.

A propos de l'IEC

La Commission Electrotechnique Internationale (IEC) est la première organisation mondiale qui élabore et publie des Normes internationales pour tout ce qui a trait à l'électricité, à l'électronique et aux technologies apparentées.

A propos des publications IEC

Le contenu technique des publications IEC est constamment revu. Veuillez vous assurer que vous possédez l'édition la plus récente, un corrigendum ou amendement peut avoir été publié.

Recherche de publications IEC - webstore.iec.ch/advsearchform

La recherche avancée permet de trouver des publications IEC en utilisant différents critères (numéro de référence, texte, comité d'études,...). Elle donne aussi des informations sur les projets et les publications remplacées ou retirées.

Le premier dictionnaire d'électrotechnologie en ligne au monde, avec plus de 22 000 articles terminologiques en anglais et en français, ainsi que les termes équivalents dans 16 langues additionnelles. Egalement appelé Vocabulaire Electrotechnique International (IEV) en ligne.

IEC Just Published - webstore.iec.ch/justpublished

Restez informé sur les nouvelles publications IEC. Just Published détaille les nouvelles publications parues. Disponible en ligne et une fois par mois par email.

Glossaire IEC - std.iec.ch/glossary

67 000 entrées terminologiques électrotechniques, en anglais et en français, extraites des articles Termes et Définitions des publications IEC parues depuis 2002. Plus certaines entrées antérieures extraites des publications des CE 37, 77, 86 et CISPR de l'IEC.

INTERNATIONAL ELECTROTECHNICAL COMMISSION

LOW-VOLTAGE SURGE PROTECTIVE DEVICES –**Part 12: Surge protective devices connected to low-voltage power systems – Selection and application principles****FOREWORD**

- 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as "IEC Publication(s)"). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
- 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.

International Standard IEC 61643-12 has been prepared by subcommittee 37A: Low-voltage surge protective devices, of IEC technical committee 37: Surge arresters.

This third edition cancels and replaces the second edition published in 2008. This edition constitutes a technical revision.

NOTE The following differing practice of a less permanent nature exists in the USA: In the USA, SPDs tested to Class I tests are not required. This exception applies to the entire document.

This edition includes the following significant technical changes with respect to the previous edition:

- a) Scope: Deleted reference to 1 500 V dc
- b) Added or revised some definitions
- c) Added new clause 4 on Need for protection

- d) Added new information on disconnecting devices
- e) Revised Characteristics of SPD
- f) Revised List of parameters for SPD selection
- g) Added new information on Measured Limiting Voltage
- h) Added or revised some Annexes

The text of this International Standard is based on the following documents:

FDIS	Report on voting
37A/341/FDIS	37A/347/RVD

Full information on the voting for the approval of this International Standard can be found in the report on voting indicated in the above table.

This document has been drafted in accordance with the ISO/IEC Directives, Part 2.

A list of all parts in the IEC 61643 series, published under the general title *Low-voltage surge protective devices*, can be found on the IEC website.

The committee has decided that the contents of this document will remain unchanged until the stability date indicated on the IEC website under "<http://webstore.iec.ch>" in the data related to the specific document. At this date, the document will be

- reconfirmed,
- withdrawn,
- replaced by a revised edition, or
- amended.

INTRODUCTION

0.1 General

Surge protective devices (SPDs) are used to protect, under specified conditions, electrical systems and equipment against various overvoltages and impulse currents, such as lightning and switching surges.

SPDs shall be selected according to their environmental conditions and the acceptable failure rate of the equipment and the SPDs.

This document provides information to the user about characteristics useful for the selection of an SPD.

This document provides information to evaluate the need for using SPDs in low-voltage systems, with reference to IEC 62305, Parts 1 to 4 and the IEC 60364 series. It also provides information on selection and coordination of SPDs, while taking into account the entire environment in which they are applied. Examples include: equipment to be protected and system characteristics, insulation levels, overvoltages, method of installation, location of SPDs, coordination of SPDs, end of life behaviour of SPDs and equipment failure consequences.

IEC 62305-2 provides a general method for evaluating the risk due to surges and lightning. IEC 60364-4-44 provides a simplified way of evaluating the risk posed to electrical installations.

Guidance on requirements for product insulation coordination is provided by IEC 60664 series. Requirements for safety (fire, overcurrent and electric shock) and installation are provided by IEC 60364 series.

The IEC 60364 series provide direct information for contractors on the installation of SPDs. IEC TR 62066 contains more information on the scientific background of surge protection.

0.2 Keys to understanding the structure of this document

The list below summarizes the structure of this document and provides a summary of the information covered in each clause and annex. The main clauses provide basic information on the factors used for SPD selection. Readers who wish to obtain more detail on the information provided in Clauses 4 to 7 should refer to the relevant annexes.

Clause 1 describes the scope of this document.

Clause 2 lists the normative references where additional information may be found.

Clause 3 provides definitions useful for the understanding of this document.

Clause 4 is an introduction to the risk of surges (considerations of when the use of SPDs is beneficial).

Clause 5 addresses the parameters of systems and equipment important for SPD selection. In addition to the stresses created by lightning, those created by the network itself are described, namely temporary overvoltages and switching surges.

Clause 6 lists the electrical parameters for the selection of an SPD and provides explanations regarding these parameters. These are related to those given in IEC 61643-11.

Clause 7 is the core of this document. It relates the stresses coming from the network (as discussed in Clause 5) to the characteristics of the SPD (as discussed in Clause 6). It also outlines how the protection by SPDs may be affected by its installation. The different steps for the selection of an SPD are presented, including coordination when more than one SPD is used in an installation (details about SPD coordination may be found in Annex F).

Annex A deals with information given with inquiries and explains the testing procedures used in IEC 61643-11.

Annex B provides examples of the relationship between two important parameters of SPDs, U_c and U_p , in the specific case of Metal Oxide Varistors (MOV) and also examples of the relationship between U_c and the nominal voltage of the network.

Annex C supplements the information given in Clause 5 on surge voltages in low-voltage systems.

Annex D deals with the sharing of lightning current between different earthing systems used to determine the SPD rating in case of direct lightning current.

Annex E deals with temporary overvoltages due to faults in the high-voltage system.

Annex F supplements the information given in Clause 7 on coordination rules when more than one SPD is used in a system.

Annex G provides specific examples on the use of this document.

Annex H provides specific examples of the use of the risk analysis given in Clause 4.

Annex I supplements the information given in Clause 5 about system stresses.

Annex J supplements the information given in Clause 7 on the application of SPDs in various low-voltage systems criteria for selection of SPDs.

Annex K discusses differences between immunity level and insulation withstand of electrical equipment.

Annex L provides practical examples of SPD installation as used in some countries.

Annex M discusses problems of coordination with equipment having both signaling and power terminals.

Annex N provides information on withstand of fuses in surge conditions.

Annex O provides practical methods for testing system level immunity.

Annex P provides test application to SPDs with multiple components.

LOW-VOLTAGE SURGE PROTECTIVE DEVICES –

Part 12: Surge protective devices connected to low-voltage power systems – Selection and application principles

1 Scope

This part of IEC 61643 describes the principles for the selection, operation, location and coordination of SPDs to be connected to 50/60 Hz AC power circuits, and equipment rated up to 1 000 V RMS.

These devices contain at least one non-linear component and are intended to limit surge voltages and divert surge currents.

NOTE 1 Additional requirements for special applications are also applicable, If required.

NOTE 2 IEC 60364 and IEC 62305-4 are also applicable.

NOTE 3 This document deal only with SPDs and not with surge protection components (SPC) integrated inside equipment.

2 Normative references

3 Terms, definitions and abbreviated terms

3.1 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- IEC Electropedia: available at <http://www.electropedia.org/>
- ISO Online browsing platform: available at <http://www.iso.org/obp>

3.1.1

surge protective device

SPD

device that contains at least one nonlinear component that is intended to limit surge voltages and divert surge currents

Note 1 to entry: An SPD is a complete assembly, having appropriate connecting means.

[SOURCE: IEC 61643-11:2011, 3.1.1]

3.1.2

continuous operating current

I_c

current flowing through each mode of protection of the SPD when energized at the maximum continuous operating voltage (U_c) for each mode

3.1.3

maximum continuous operating voltage

U_c

Maximum RMS voltage which may be continuously applied to the SPD's mode of protection

Note 1 to entry The U_c value covered by this document may exceed 1 000 V.

[SOURCE: IEC 61643-11:2011, 3.1.11]

3.1.4

voltage protection level

U_p

maximum voltage to be expected at the SPD terminals due to an impulse stress with defined voltage steepness and an impulse stress with a discharge current with given amplitude and waveshape

Note 1 to entry: The voltage protection level is given by the manufacturer and is equal or exceed by:

- the measured limiting voltage, determined for front-of-wave sparkover (if applicable) and the measured limiting voltage, determined from the residual voltage measurements at amplitudes up to I_n and/or I_{imp} for test Classes II and/or I, respectively;
- the measured limiting voltage up to U_{OC} determined for the combination wave generator for test Class III.
