Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 22, *Road vehicles*, Subcommittee SC 36, *Safety and impact testing*.

This second edition cancels and replaces the first edition (ISO 13215-2:1999) which has been technically revised.

The main changes are as follows:

— added introduction;

— general update to cover ISOFIX / LATCH solutions, which did not exist by the time of publication of the first edition;

— new illustrations;

— editorial improvements.

A list of all parts in the ISO 13215 series can be found on the ISO website.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html.

Introduction

Whether or not adequate protection is provided to a child occupant in a vehicle crash depends not only on the inherent capability of the child restraint system to provide protection, but also on its proper installation and subsequent correct use. It is known that certain misuse configurations and interface problems can have serious consequences for child occupants in vehicle crashes.

A clear understanding of the kind and frequency of incorrect use has important implications for the design of child restraint systems and instructions for use, the vehicle in which they are used, education and loan programs, and legislation.

The panel method presented in this document is supporting anyone who works with a panel of parents, caregivers or other panel participants to evaluate child restraint systems in terms of likelihood of correct installations or risk of misuse.

This document can be used in conjunction with the MMEA method presented in ISO 13215-3, to predict and evaluate possible misuse of the intended design, and to address possible misuse modes by an improved design. This document can also provide additional support in the use of panels for usability evaluations according to the ISO 29061 series.

Road vehicles — Reduction of misuse risk of child restraint systems —

Part 2: Requirements and test procedures for correct installation (panel method)

1 Scope

This document specifies the requirements and methods for judging the risk of installation misuse of child restraint systems (CRS) with the help of assigned evaluation panels.

The methods described can be used regardless of type of installation of the CRS, e.g. with vehicle seat belts, ISOFIX/LATCH and different types of anti-rotation devices. The installation can include the evaluation of the interface between the child and the CRS, e.g. a harness or an impact shield.

This document is intended for technical assessment. It can be applied separately or in conjunction with the MMEA evaluation, described in ISO 13215-3.

2 Normative references

There are no normative references in this document.

3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

ISO and IEC maintain terminology databases for use in standardization at the following addresses:

— ISO Online browsing platform: available at https://www.iso.org/obp

— IEC Electropedia: available at https://www.electropedia.org/

3.1
child restraint system
CRS
free-standing device intended to provide child vehicle occupants with an approved restraint

Note 1 to entry: Child restraint systems comprise various categories, such as infant restraints, toddler seats, booster cushions and booster seats.

3.2
misuse
any deviation from the intended application and use which might reduce the protective performance of the *child restraint system* (3.1)

3.3
ISOFIX
system for the connection of a *child restraint system (CRS)* (3.1) to vehicles, which has two rigid anchorages in a vehicle seating position located near the seat bight, corresponding rigid attachments on the CRS, and a means to limit the pitch rotation of the CRS

Note 1 to entry: In this document, the term ISOFIX includes flexible CRS attachments (LATCH, UAS).
