

ICS 43.120

English Version

Technical Requirements for Current Collectors for ground-level feeding system on road vehicles in operation

Exigences techniques relatives aux capteurs de courant
pour les systèmes d'alimentation au sol sur les véhicules
routiers

Technische Anforderungen an Stromabnehmer für
bodennahe Einspeiseanlagen in Straßenfahrzeugen im
Betrieb

This Technical Specification was approved by CENELEC on 2022-11-07.

CENELEC members are required to announce the existence of this TS in the same way as for an EN and to make the TS available promptly at national level in an appropriate form. It is permissible to keep conflicting national standards in force.

CENELEC members are the national electrotechnical committees of Austria, Belgium, Bulgaria, Croatia, Cyprus, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, the Netherlands, Norway, Poland, Portugal, Republic of North Macedonia, Romania, Serbia, Slovakia, Slovenia, Spain, Sweden, Switzerland, Türkiye and the United Kingdom.

European foreword

This document (CLC/TS 50717:2022) has been prepared by CLC/TC 9X/WG 30 “Technical Requirements for Current Collectors for ground-level feeding system on road vehicles in operation”.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. CENELEC shall not be held responsible for identifying any or all such patent rights.

This document has been prepared under a Standardization Request given to CENELEC by the European Commission and the European Free Trade Association.

Any feedback and questions on this document should be directed to the users' national committee. A complete listing of these bodies can be found on the CENELEC website.

Introduction

Road traffic borne carbon dioxide and other emissions create a growing challenge that needs to be overcome to achieve commonly agreed climate targets.

This document is limited to current collector devices used in ground-based conductive feeding system by contact. The dynamic electric power supply of a road vehicle is achieved by the collection of current from the metallic segments at road level by means of one or more current collector devices installed underneath the electric vehicle or coupled traction trailers.

As road traffic is highly internationalized and standardized, Electric Road System (ERS) solutions for dynamic supply of vehicles need to be standardized.

The current collector device interoperability objectives are defined between countries and vehicle types, but not between ground-based conductive feeding system technical solutions.

NOTE Annex A presents the architecture for the whole Electric Road System (ERS) for information.

1 Scope

This document specifies the general characteristics which are to be applied to ground level current collector devices, to enable conductive current collection by road vehicles from a feeding track integrated in the roadway.

It defines the interfaces between the current collector device and its environment as well as the electrical safety concept.

It also specifies the necessary tests for the current collector devices and gives recommendations for their maintenance.

This document is applicable to current collector devices on road vehicles for ground-level feeding operation on electrified public roads and highways.

This document is not applicable to motorcycles (including tricycles and quadricycles).

This document is not applicable to vehicles or electric buses with dynamic or static inductive charging systems and related power supplies.

3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- ISO Online browsing platform: available at <https://www.iso.org/obp>
- IEC Electropedia: available at <https://www.electropedia.org/>

3.1

electric road system

ERS

system that enables dynamic power transfer to ERS vehicles whilst they are driving

Note 1 to entry: By integrating power transfer technology into existing road infrastructure, an electrified road will be accessible to both vehicles that use power transmission and other vehicles.

3.2

current collector device

CCD

retractable mechanical apparatus mounted underneath the vehicle which is intended to collect by contact the current from ERS segments

Note 1 to entry: CCD is “on” when supplied with ELV and “off” when it is not supplied.

3.3

wearing strip

part of the collector shoe which is the friction and wearing part of the CCD

3.4

collector shoe

part of the current collector device which is lowered to be in contact with the conductive segment and collects power through its wearing strips

3.5

CCD control unit

electronic device responsible for managing the positions of the retractable current collector device

3.6

actuator system

system used to operate the current collector device from one position to another
