Gas meters - Conversion devices - Part 3: Flow computer

Compteurs de gaz - Dispositifs de conversion - Partie 3:  
Calculateurs de débit

Gaszähler - Umwerter - Teil 3: Flowcomputer

This European Standard was approved by CEN on 19 September 2015.

CEN members are bound to comply with the CEN/CENELEC Internal Regulations which stipulate the conditions for giving this European Standard the status of a national standard without any alteration. Up-to-date lists and bibliographical references concerning such national standards may be obtained on application to the CEN-CENELEC Management Centre or to any CEN member.

This European Standard exists in three official versions (English, French, German). A version in any other language made by translation under the responsibility of a CEN member into its own language and notified to the CEN-CENELEC Management Centre has the same status as the official versions.

CEN members are the national standards bodies of Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, Former Yugoslav Republic of Macedonia, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and United Kingdom.

## European foreword

This document (EN 12405-3:2015) has been prepared by Technical Committee CEN/TC 237 "Gas meters", the secretariat of which is held by BSI.

This European Standard shall be given the status of a national standard, either by publication of an identical text or by endorsement, at the latest by June 2016, and conflicting national standards shall be withdrawn at the latest by June 2016.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. CEN [and/or CENELEC] shall not be held responsible for identifying any or all such patent rights.

EN 12405 consists of the following parts:

- Part 1: Volume conversion (and its amendments EN 12405-1:2005/A1:2006 and EN 12405-1:2005+A2:2010 to allow the harmonization of the standard with the Measuring Instruments Directive 2004/22/EC);
- Part 2: Energy conversion;
- Part 3: flow computer (this European Standard).

In the preparation of this European Standard, the content of OIML Publication, "Recommendation 140 – measuring systems for gaseous fuel", has been taken into account.

According to the CEN/CENELEC Internal Regulations, the national standards organizations of the following countries are bound to implement this European Standard: Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, Former Yugoslav Republic of Macedonia, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and the United Kingdom.

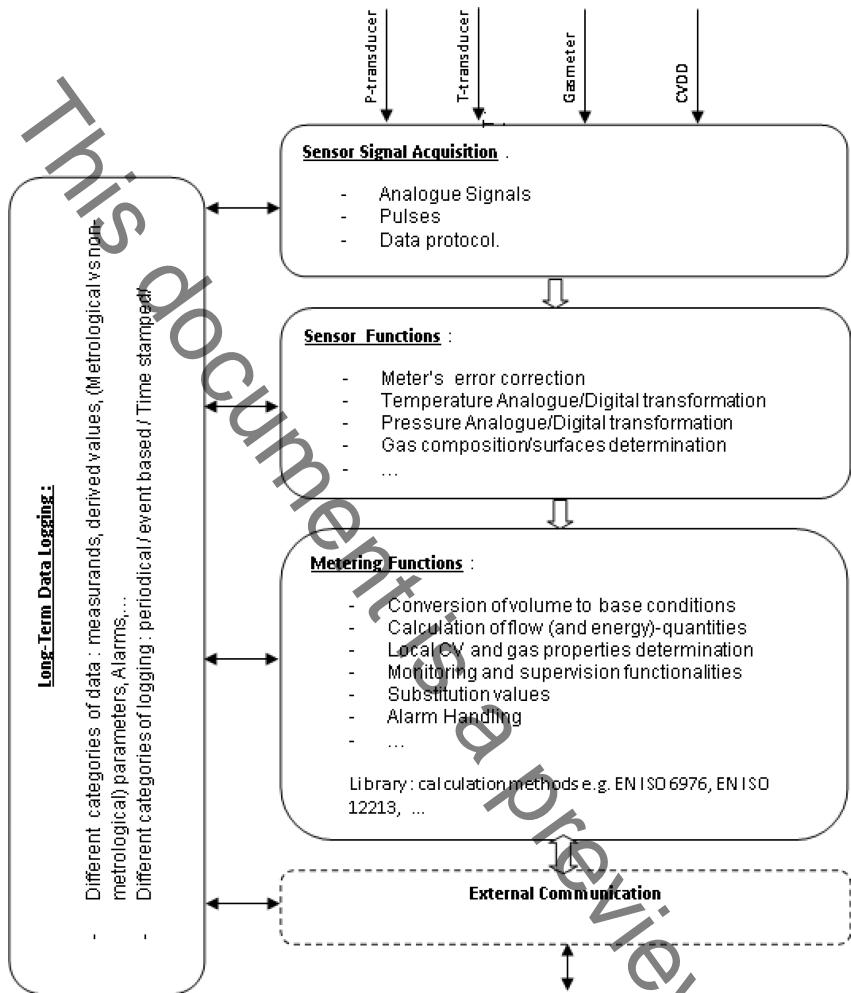

## Introduction

A high accuracy volume conversion device can be needed depending of the intended use. EN 12405-3 is established in order to meet severe requirements concerning accuracy and related functions.

For the purpose of this European Standard, functions are described, although these functions can be physically located in different components (e.g. calibration curve programmed in the measuring equipment itself or in the calculator).

Four main categories of functions are described to achieve data processing:

- Sensor signal Acquisition functions: to process signals from physical quantity provided by sensors and transducers to measurands;
- Sensor functions: to convert measurands to correct measurements, mostly based upon calibration results and filtering procedures;
- Metering functions: to calculate derived values such as volume, calorific value, compression factor etc. based upon international standards and formulas and to take care of the supervision and monitoring for the purpose of high accuracy and substitution values;
- Long Term Data Storage functions: to keep all relevant information necessary to construct or reconstruct calculated values:
  - for later legally relevant purposes (e.g. the conclusion of a commercial transaction);
  - for back up of the relevant data.

**Figure 1 — Description of the functionalities of the flow computer calculator**

### **Modular and global approaches**

In the modular approach, the flow computer is an assembly of separate associated measuring instruments and a calculator, which are verified separately. Each instrument is verified according to its testing procedure, using the indication available on the calculator or on the associated measuring instrument itself. In this case, the indication shall correspond to the indication of that measuring instrument, which is directly performing volume conversion. The verification of the functions consists in verifying the calculation concerning each characteristic quantity of the gas and/or the calculation for the volume conversion.

In case of external communication, sufficient resolution of required data is ensured during data transmission.

The associated measuring instruments are validated for or with a type calculator in order to ensure the interoperability of the association.

CVDD is covered in EN 12405-2.

In the global approach, the flow computer is tested as a package including the calculator and its associated measuring instruments and functions.

The testing procedures are given in Annex A.

## 1 Scope

Part 3 of this European Standard specifies the requirements and tests for the construction, performance, safety and conformity of flow computers (FCs) used to meet the metrological and technical requirements of a high accuracy volume conversion device.

They are used to determine volume of fuel gases, including those of the first and second families according to EN 437.

For the purpose of this European Standard, only flow computers that are intended to operate with ultrasonic meters according to ISO 17089-1 or gas turbine meters conforming to EN 12261 are considered.

For the purpose of this European Standard only classification classes E2 and M1 are considered for the flow computer calculator.

FCs are equipped with external separate transducers for pressure and temperature which may be approved separately.

The provisions concerning pressure and temperature transducers are given in Annex B and C.

Requirements and tests are given for energy calculator in EN 12405-2.

### **3 Terms, definitions and symbols**

#### **3.1 Terms and definitions**

For the purposes of this document, the following terms and definitions apply.

##### **3.1.1**

##### **absolute pressure**

value of the pressure of the gas relative to vacuum

##### **3.1.2**

##### **associated measuring instrument**

instrument for measuring certain quantities which are characteristic of the gas, e.g. temperature, pressure, or calorific value, whose indications are used by the calculator with a view to making a correction and/or a conversion

Note 1 to entry: For the purpose of this European Standard, when dealing with the ECD in modular approach, the VCD and CVDD are considered as associated measuring instrument.

##### **3.1.3**

##### **base conditions**

fixed conditions used to express the volume of gas independently of the measurement conditions and the superior calorific value

Note 1 to entry: The pressure base for both volumetric metering and combustion is always 1,01325 bar. The temperature is specified.

EXAMPLE Temperature of 273,15 K and absolute pressure of 1,013 25 bar or temperature of 288,15 K and absolute pressure of 1,013 25 bar.

##### **3.1.4**

##### **calculator**

electronic device that receives the output signals from measuring and data acquisition systems, e.g. associated gas meter or transducers, and processes them
