Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in Maison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of technical committees is to prepare International Standards. Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights.

ISO 20965 was prepared by Technical Contripitee ISO/TC 61, Plastics, Subcommittee SC 5, Physical-chemical properties.

Plastics — Determination of the transient extensional viscosity of polymer melts

1 Scope

This International Standard specifies the general principles of a method for determining the transient extensional viscosity of follymer melts. The procedure details the measurement of polymer melt specimens stretched uniaxially under conditions of constant strain rate and constant temperature.

The method is capable of measuring the transient extensional viscosity of polymer melts at Hencky strain rates typically in the range $0.01 \, \mathrm{s}^{-1}$ to $1 \, \mathrm{s}^{-1}$, at Hencky strains up to approximately 4 and at temperatures up to approximately 250 °C (see Noiss 1 and 2). It is suitable for measuring transient extensional viscosity values typically in the range from approximately $10^4 \, \mathrm{Pa} \cdot \mathrm{s}$ to $10^7 \, \mathrm{Pa} \cdot \mathrm{s}$ (see Note 3).

NOTE 1 Hencky strains and strain rates are used (see Clause 3).

NOTE 2 Values of strain, strain rate and temperature outside these limiting values may be attained.

NOTE 3 The operating limit of an instrument of the lowest transient extensional viscosity values that can be measured, is due to a combination of factors, including the ability of the specimen to maintain its shape during testing and the resolution of the instrument.

A list of documents related to this International Standard is given in the Bibliography.

2 Normative references

The following referenced documents are indispensable for the application of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO 472, Plastics — Vocabulary

3 Terms and definitions

For the purposes of this document, the terms and definitions given in ISO 422, together with the following, apply.

Definitions 3.1 to 3.5 are given by Whorlow [1] for strains and strain rates, and by the Nomenclature Committee of the Society of Rheology for start-up flow in tensile uniaxial extension at constant Hencky strain rate [2].

3.1

Hencky strain

strain given by the natural logarithm of the elongation ratio

$$\varepsilon = \ln(l/l_0) \tag{1}$$

where l is the specimen length and l_0 is the original specimen length
