Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in Maison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of technical confirmtees is to prepare International Standards. Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires applying by at least 75 % of the member bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights.

1809-3 was prepare stroleum, petrochemical and .

21809 consists of the following parts, under rnal coatings for buried or submerged pipelines as a coating of the following parts, under rnal coatings for buried or submerged pipelines as a coating of the following parts, under rnal coatings for buried or submerged pipelines as a coating of the following parts, under rnal coatings for buried or submerged pipelines as a coating of the following parts, under rnal coatings for buried or submerged pipelines as a coating of the following parts, under rnal coatings for buried or submerged pipelines as a coating of the following parts, under rnal coatings for buried or submerged pipelines as a coating of the following parts, under rnal coatings for buried or submerged pipelines as a coating of the following parts, under rnal coatings for buried or submerged pipelines as a coating of the following parts, under rnal coatings for buried or submerged pipelines as a coating of the following parts, under rnal coatings for buried or submerged pipelines as a coating of the following parts, under rnal coatings for buried or submerged pipelines as a coating of the following parts, under rnal coatings for buried or submerged pipelines as a coating of the following parts and the following parts are represented by the following parts and the following parts are represented by the fo ISO 21809-3 was prepared by Technical Committee ISO/TC 67, *Materials, equipment and offshore structures for petroleum, petrochemical and natural gas industries*, Subcommittee SC 2, *Pipeline transportation systems*.

ISO 21809 consists of the following parts, under the general title Petroleum and natural gas industries — External coatings for buried or submerged pipelines used in pipeline transportation systems:

A Part 6, dealing with bitumen, asphalt and coaltar coatings, a Part 7, dealing with liquid coatings, a Part 8, dealing with thermal insulation coatings, and a Part 9, dealing with epoxy polyamide powder coatings (2-layer) are under preparation.

Introduction

Users of this part of ISO 21809 should be aware that further or differing requirements can be needed for individual applications. This part of ISO 21809 is not intended to inhibit a vendor from offering, or the purchaser from accepting, alternative equipment or engineering solutions for the individual application. This

Users of this part of ISO 21809 should be aware that further or during requirements can be needed for individual applications. This part of ISO 21809 is not intended to inhibit a vendor from offering, or the purchaser from accepting, alternative equipment or engineering solutions for the individual application. This can be particularly applicable where there is innovative or developing technology. Where an alternative is offered, the vendor should identify any variations from this part of ISO 21809 and provide details.

Petroleum and natural gas industries — External coatings for buried or submerged pipelines used in pipeline transportation systems —

Part 3: Field joint poatings

1 Scope

This part of ISO 21809 specifies requirements for field joint coating of seamless or welded steel pipes for pipeline transportation systems in the petroleum and natural gas industries as defined in ISO 13623. This part of ISO 21809 specifies the qualification, application and testing of the corrosion protection coatings applied to steel surfaces left bare after the pipes and fittings (components) are joined by welding.

This part of ISO 21809 does not address additional mechanical protection, thermal insulation or joint infills for concrete weight-coated pipes.

This part of ISO 21809 defines and codifies the different types of field joint coatings for buried or submerged pipelines as presented in Table 1.

NOTE Pipes coated in accordance with this part of 20 21809 are considered suitable for further protection by means of cathodic protection.

3 Terms and definition

following terms and definitions apply. For the purposes of this document.

3.1

application procedure specification **APS**

document describing procedures, methods, equipment and tools used for coating application

3.2

applicator

company that undertakes the coating application in ascordance with the provisions of this part of ISO 21809

3.3

batch

exeration using raw materials of the same source quantity of material produced in a continuous manufacturing and grade

3.4

batch certificate

certificate of analysis issued by the manufacturer

3.5

bonding agent

material applied as a film to the primed metal surface in order to ensure adhesing of the subsequent protective coating

3.6

certificate of compliance

one of the types of inspection documents defined by ISO 10474, issued in accordance with the purchasing requirements

3.7

coating operative

individual undertaking coating activity on the work site, including surface preparation

3.8

cutback

length of pipe left uncoated at each end for joining purposes (e.g. welding)
