## Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of technical committees is to prepare International Standards. Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights.

ISO 15195 was prepared by Technical Committee ISO/TC 212, *Clinical laboratory testing and in vitro diagnostic test systems*.

## Introduction

The general requirements for the competence of calibration laboratories are laid down in ISO/IEC 17025 for testing and calibration laboratories. This International Standard refers to the specific aspects of calibration laboratories in the field of laboratory medicine where such “calibration laboratories” are usually denoted as “reference measurement laboratories.”

The results produced by medical laboratories should be traceable to reference materials and/or reference measurement procedures of higher order, whenever these are available. This is necessary in order to allow transferability of measurement results in patient samples irrespective of the place and time of measurement.

In order to achieve this goal, the first and essential step is to define the quantity to be measured. Once the quantity has been defined, a reference measurement system should be established, consisting of

- reference materials,
- reference measurement procedures, and
- reference measurement laboratories.

The reference measurement laboratories should be embedded in international (global) networks organized under the auspices of, for example, International Federation of Clinical Chemistry and Laboratory Medicine (IFCC) and International Committee of weights and Measures (CIPM).

Reference measurement laboratories must operate with a traceability to the highest metrological level available and with a lower uncertainty than routine laboratories. The metrological level of the results provided by reference measurement laboratories should be appropriate to enable routine laboratories to fulfil medical requirements. The specific requirements of medical laboratories carrying out routine measurements are addressed in ISO 15189.

The presentation of reference measurement procedures and the description of reference materials are the subject of ISO standards (ISO 15193 and ISO 15194, respectively). This International Standard describes the performance characteristics required for reference measurement laboratories in laboratory medicine. These are highly specialized laboratories often attached to or subcontracted by entities such as national metrology institutes, quality assessment/proficiency testing organizations, academic centres, or *in vitro* diagnostic medical device manufacturers.

Reference measurement laboratories should implement reference measurement procedures and produce results of measurement that are accurate and traceable to national or international primary reference materials when such are available. Whenever possible, traceability should be established to a reference material which forms an embodiment of the SI unit (ISO 17511).

In many instances, properties of biological materials cannot be expressed in SI units as the molecular structure of their analytes is not exactly known and may be different in a reference material from that in a native sample of human origin (e.g. state of glycosylation of a protein); then the traceability chain ends at a lower level, e.g., at an arbitrary international unit (int. unit). However, the reference measurement laboratory should provide traceable values on reference materials supplied by customers to the highest available level of reference measurement procedures or reference materials.

Even if the value for a property of a biological material is not traceable to an SI unit, each step of a reference measurement procedure (e.g. gravimetry, volumetry, temperature measurement) should have values that are traceable to the respective SI unit.

The traceability concept, its applicability and limitations are described in detail in the standard "Metrological traceability of values assigned to calibrators and control materials" (ISO 17511).

Further tasks of reference measurement laboratories may include upon request:

- assisting in investigation of new or existing measurement procedures with regard to their trueness,
- providing accurate (true and precise) assigned values with stated uncertainty to materials for calibration, internal quality control, and external quality assessment,
- acting as consultants to government, industry, and organizations conducting external quality assessment schemes as well as to specialized individual laboratories.

The requirements described in this document and in ISO/IEC 17025 are prerequisites for reference measurement laboratories to perform their tasks adequately. When the reference measurement laboratory is integrated into a routine laboratory, the management system, personnel and equipment requirements of the reference laboratory should comply with this International Standard and be independent of the routine laboratory.

This International Standard should aid in establishing confidence in reference measurement laboratories that are able to demonstrate their competence in accordance with the requirements laid down here.

This International Standard may form a basis for the accreditation of a reference measurement laboratory that applies for official recognition of the performance of a reference measurement procedure. Reference measurement laboratories are usually accredited by the national metrology institutes or national accrediting bodies.

NOTE The requirements for recognition and operation are set out in ISO/IEC Guide 58. The International Laboratory Accreditation Cooperation (ILAC) coordinates and supervises the regional organizations of national accrediting bodies, such as the European Cooperation for Accreditation (EA), which ensures that member bodies recognize each other's accreditation certificates.

This International Standard may furthermore facilitate collaboration between reference measurement laboratories performing interlaboratory comparisons and encourage the highly desirable formation of international networks of reference measurement laboratories.

It is understood that reference measurement procedures should be of high metrological order and the analytical principle of measurement applied should allow an adequately low uncertainty. The results of reference measurements should be traceable to reference materials or to a reference procedure of higher order when available.

# Laboratory medicine — Requirements for reference measurement laboratories

## 1 Scope

This International Standard gives the specific requirements for reference measurement laboratories in laboratory medicine. Examinations of properties with results reported on a nominal or ordinal scale are not included.

This International Standard is not applicable to routine medical laboratories.

NOTE 1 It is the laboratory's responsibility to comply with the relevant legal health and safety requirements.

NOTE 2 Requirements for routine medical laboratories are specified in ISO 15189.
