## Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see [www.iso.org/directives](http://www.iso.org/directives)).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see [www.iso.org/patents](http://www.iso.org/patents)).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the WTO principles in the Technical Barriers to Trade (TBT) see the following URL: Foreword - Supplementary information

The committee responsible for this document is ISO/TC 204, *Intelligent transport systems*.

ISO 17427 consists of the following parts, under the general title *Intelligent transport systems — Cooperative ITS*:

- *Part 2: Framework Overview* [Technical Report]
- *Part 3: Concept of operations (ConOps) for 'core' systems* [Technical Report]
- *Part 4: Minimum system requirements and behaviour for core systems* [Technical Report]
- *Part 6: 'Core system' risk assessment methodology* [Technical Report]
- *Part 7: Privacy aspects* [Technical Report]
- *Part 8: Liability aspects* [Technical Report]
- *Part 9: Compliance and enforcement aspects* [Technical Report]
- *Part 10: Driver distraction and information display* [Technical Report]

The following parts are under preparation:

- *Part 1: Roles and responsibilities in the context of co-operative ITS architecture(s)*
- *Part 5: Common approaches to security* [Technical Report]
- *Part 11: Compliance and enforcement aspects* [Technical Report]
- *Part 12: Release processes* [Technical Report]
- *Part 13: Use case test cases* [Technical Report]
- *Part 14: Maintenance requirements and processes* [Technical Report]

Further technical reports in this series are expected to follow. Please also note that these TRs are expected to be updated from time to time as the C-ITS evolves.

This document is a preview generated by EVS

## Introduction

Intelligent transport systems (*ITS*) are transport systems in which advanced information, communication, sensor and control technologies, including the Internet, are applied to increase safety, sustainability, efficiency, and comfort.

A distinguishing feature of '*ITS*' are its communication with outside entities.

Some *ITS* systems operate autonomously, for example 'adaptive cruise control' uses radar/lidar/and/or video to characterize the behaviour of the vehicle in front and adjust its vehicle speed accordingly. Some *ITS* systems are informative, for example 'Variable Message Signs' at the roadside, or transmitted into the vehicle, provide information and advice to the driver. Some *ITS* systems are semi-autonomous, in that they are largely autonomous, but rely on 'static' or 'broadcast' data, for example, *GNSS* based 'SatNav' systems operate autonomously within a vehicle but are dependent on receiving data broadcast from satellites in order to calculate the location of the vehicle.

Cooperative Intelligent Transport Systems (*C-ITS*) are a group of *ITS* technologies where service provision is enabled by, or enhanced by, the use of 'live', present situation related, dynamic data/information from other entities of similar functionality (for example from one vehicle to other vehicle(s)), and/or between different elements of the transport network, including vehicles and infrastructure (for example from the vehicle to an infrastructure managed system or from an infrastructure managed system to vehicle(s)). Effectively, these systems allow vehicles to 'talk' to each other and to the infrastructure. These systems have significant potential to improve the transport network.

A distinguishing feature of '*C-ITS*' is that data are used across *application/service* boundaries.

It will be immediately clear to the reader that such systems present the possibility to seriously compromise privacy, and must, and will, be strictly controlled by regulation and managed to prevent abuse of privacy by any party. The purpose of this Technical Report is to identify potential critical privacy issues that *C-ITS* service provision may introduce, to consider how to control, limit or mitigate such privacy issues, and to limit the risk of exposure to the financial consequences of privacy issues.

This Technical Report is a 'living document' and as our experience with *C-ITS* develops, it is intended that it will be updated from time to time, as and when we see opportunities to improve this Technical Report.

# Intelligent transport systems — Cooperative ITS —

## Part 7: Privacy aspects

### 1 Scope

The scope of this Technical Report is as an informative document to identify potential critical privacy issues that *C-ITS* service provision may introduce; to consider strategies for how to control, limit or mitigate such privacy issues; and to give pointers, where appropriate, to standards deliverables existing that provide specifications for all or some of these aspect and to limit the risk of exposure to the financial consequences of privacy issues.

The objective of this Technical Report is to raise awareness of and consideration of such issues. This Technical Report does not provide specifications for solutions of these issues.

### 2 Terms and definitions

#### 2.1

##### **application**

##### **app**

software application

#### 2.2

##### **application service**

service provided by a service provider accessing data from the *IVS* (2.6) within the vehicle in the case of *C-ITS*, via a wireless communications network, or provided on-board the vehicle as the result of software (and potentially also hardware and firmware) installed by a service provider or to a service providers instruction

#### 2.3

##### **cooperative ITS**

##### **C-ITS**

group of *ITS* technologies where service provision is enabled, or enhanced by, the use of 'live', present situation related, data/information from other entities of similar functionality [for example, from one vehicle to other vehicle(s)], and/or between different elements of the transport network, including vehicles and infrastructure

[SOURCE: for example from the vehicle to an infrastructure managed system or from an infrastructure managed system to vehicle(s)]

#### 2.4

##### **core system**

combination of enabling technologies and services that will provide the foundation for the support of a distributed, diverse set of *applications* (2.1), and *application* transactions which work in conjunction with 'External Support Systems' such as 'Certificate Authorities'

Note 1 to entry: the system boundary for the core system is not defined in terms of devices or agencies or vendors, but by the open, standardized interface specifications that govern the behaviour of all interactions between core system users
