Kommunikation in offenen Übertragungs-
systemen

This European Standard was approved by CENELEC on 2000-01-01. CENELEC members are bound to comply with the CEN/CENELEC Internal Regulations which stipulate the conditions for giving this European Standard the status of a national standard without any alteration.

Up-to-date lists and bibliographical references concerning such national standards may be obtained on application to the Central Secretariat or to any CENELEC member.

This European Standard exists in three official versions (English, French, German). A version in any other language made by translation under the responsibility of a CENELEC member into its own language and notified to the Central Secretariat has the same status as the official versions.

CENELEC members are the national electrotechnical committees of Austria, Belgium, Czech Republic, Denmark, Finland, France, Germany, Greece, Iceland, Ireland, Italy, Luxembourg, Netherlands, Norway, Portugal, Spain, Sweden, Switzerland and United Kingdom.

European Committee for Electrotechnical Standardization
Comité Européen de Normalisation Electrotechnique
Europäisches Komitee für Elektrotechnische Normung

Central Secretariat: rue de Stassart 35, B - 1050 Brussels

Foreword

This European Standard was prepared by SC 9XA, Communication, signalling and processing systems, of Technical Committee CENELEC TC 9X, Electrical and electronic applications for railways.

The text of the draft was submitted to the formal vote and was approved by CENELEC as EN 50159-2 on 2000-01-01.

The following dates were fixed:

- latest date by which the EN has to be implemented
at national level by publication of an identical
national standard or by endorsement (dop) 2001-10-01
- latest date by which the national standards conflicting
with the EN have to be withdrawn (dow) 2003-01-01

Annexes designated “informative” are given for information only.
In this standard, annexes A, B, C and D are informative.

D.5 Conclusions.....	43

Introduction

If a safety-related electronic system involves the transfer of information between different locations, the communication system then forms an integral part of the safety-related system and it must be shown that the end to end transmission is safe in accordance with ENV 50129.

The safety requirements for a data communication system depend on its characteristics which can be known or not. In order to reduce the complexity of the approach to demonstrate the safety of the system two classes of transmission systems have been considered. The first class consists of the ones over which the safety system designer has some degree of control. It is the case of the closed transmission systems whose safety requirements are defined in EN 50159-1. The second class, named open transmission system, consists of all the systems whose characteristics are unknown or partly unknown. This standard defines the safety requirements addressed to the transmission through open transmission systems.

The transmission system, which is considered in this standard, has in general no particular preconditions to satisfy. It is from the safety point of view not or not fully trusted and is considered as a "black box".

This standard is closely related to EN 50159-1 "Safety-related communication in closed transmission systems" and ENV 50129 "Safety related electronic systems for signalling".

The standard is dedicated to the requirements to be taken into account for the transmission of safety-related information over open transmission systems.

Cross-acceptance, aimed at generic approval and not at specific applications, is required in the same way as for ENV 50129 "Safety related electronic systems for signalling".

1 Scope

This European Standard is applicable to safety-related electronic systems using an open transmission system for communication purposes. It gives the basic requirements needed, in order to achieve safety-related transmission between safety-related equipment connected to the open transmission system.

This standard is applicable to the safety requirement specification of the safety-related equipment, connected to the open transmission system, in order to obtain the allocated safety integrity level.

The properties and behaviour of the open transmission system are only used for the definition of the performance, but not for safety. Therefore from the safety point of view the open transmission system can potentially have any property, as various transmission ways, storage of messages, unauthorised access, etc.. The safety process shall only rely on properties, which are demonstrated in the safety case.

The safety requirement specification is a precondition of the safety case of a safety-related electronic system for which the required evidences are defined in ENV 50129. Evidence of safety management and quality management has to be taken from ENV 50129. The communication related requirements for evidence of functional and technical safety are the subject of this standard.

This standard is not applicable to existing systems, which had already been accepted prior to the release of this standard.

This standard does not specify:

- the open transmission system,
- equipment connected to the open transmission system,
- solutions (e.g. for interoperability),
- which kinds of data are safety-related and which are not.

2 Normative references

This European Standard incorporates by dated or undated reference, provisions from other publications. These normative references are cited at appropriate places in the text and the publications are listed hereafter. For dated references, subsequent amendments to or revisions of these publications apply to this European Standard only when incorporated in it by amendment or revision. For undated references the latest edition of the publication referred to applies.

EN 50126	Railway applications - The specification and demonstration of Reliability, Availability, Maintainability and Safety (RAMS)
EN 50128	Railway applications - Communications, signalling and processing systems - Software for railway control and protection systems
ENV 50129	Railway applications - Safety related electronic systems for signalling

3 Definitions

For the purpose of this standard, the following definitions apply:

3.1

access protection

processes designed to prevent *unauthorised* access to read or to alter *information*, either within user *safety-related* systems or within the *transmission system*

3.1.1

hacker

a person trying deliberately to bypass *access protection*
