Garment construction and anthropometric surveys — Body dimensions

*Confection des vêtements et relevés anthropométriques — Mesures du corps
humain*

Reference number
ISO 8559 : 1989 (E)

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

Draft International Standards adopted by the technical committees are circulated to the member bodies for approval before their acceptance as International Standards by the ISO Council. They are approved in accordance with ISO procedures requiring at least 75 % approval by the member bodies voting.

International Standard ISO 8559 was prepared by Technical Committee ISO/TC 133, *Sizing systems and designations for clothes*.

Garment construction and anthropometric surveys — Body dimensions

0 Introduction

A prerequisite for conducting anthropometric surveys and for preparing patterns for garment manufacturing purposes is a list of appropriate body dimensions which are adequately defined.

This International Standard is intended as a reference document comprising definitions for and the location of body dimensions used for garment construction.

1 Scope and field of application

This International Standard defines the location of body dimensions taken on anthropometric surveys and for the preparation of garment patterns and garment stands, and specifies a standard procedure for measuring the body.

The location and taking of body dimensions appropriate to all items of clothing and accessories for all population groups are covered in this International Standard.

The use of calipers and horizontally orientated anthropometers to determine width dimensions is excluded.

Not all the body dimensions defined in this International Standard are always necessary during anthropometric surveys or in the manufacture of clothes.

2 Definitions

For the purposes of this International Standard, the definitions are presented in a natural sequence of measurement comprising the following three elements:

- a) horizontal measurements (including girth);
- b) vertical measurements;
- c) other measurements.

The order of the vertical dimensions groups, firstly, those dimensions measured using the measuring stand and, secondly, those dimensions measured using a tape-measure held against the body.

NOTE — The apparatus and measurement methods referred to in the definitions are specified in clause 3.

2.1 Horizontal dimensions

2.1.1 head girth: The maximum horizontal girth of the head measured above the ears (see figure 1).

2.1.2 neck girth: The girth of the neck measured using the tape-measure passed round below the Adam's apple and at the level of the 7th cervical vertebra (see figure 1).
