Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of document should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives or www.iec.ch/members_experts/refdocs).

ISO and IEC draw attention to the possibility that the implementation of this document may involve the use of (a) patent(s). ISO and IEC take no position concerning the evidence, validity or applicability of any claimed patent rights in respect thereof. As of the date of publication of this document, ISO and IEC had not received notice of (a) patent(s) which may be required to implement this document. However, implementers are cautioned that this may not represent the latest information, which may be obtained from the patent database available at www.iso.org/patents and <https://patents.iec.ch>. ISO and IEC shall not be held responsible for identifying any or all such patent rights.

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see www.iso.org/iso/foreword.html. In the IEC, see www.iec.ch/understanding-standards.

This document was prepared by Joint Technical Committee ISO/IEC JTC 1, *Information technology*, Subcommittee SC 35, *User interfaces*.

A list of all parts in the ISO/IEC 20071 series can be found on the ISO and IEC websites.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html and www.iec.ch/national-committees.

Introduction

Face-to-face communication (e.g. vocal speech and sign language) is the most basic and oldest means of communication between humans. Speech communication only works when the various persons involved share a common natural language. Today, there are over 7 000 natural languages in the world. Speech between two persons not sharing a common language only works if they have one or more translators to assist them.

Pictures are the oldest form of recording communications for other humans to receive at a later point in time. While some pictures can be challenging to understand, simple pictures that clearly represent what is being communicated are a good way of communicating between humans who can see the pictures.

Written text arrived later as a means of recording speech communications. However, there are over 3 000 natural languages that do not have a written form. Thus, written text only works for human-to-human communications where both humans share the ability to use the same written language. Text has recently taken a much more critical role in communications due to the printing of books and the use of text by computer systems. Some people who communicate face-to-face via text find it easier to communicate face-to-face with pictograms.

Pictograms, like early forms of writing in some natural languages, use simple pictures to communicate with persons who cannot speak or use the written form of some natural language.

Augmentative and alternative communication (AAC) makes use of pictograms and other alternate forms of communication to serve a variety of users not able to fully use the available spoken or written language.

NOTE While the most common use of AAC is to facilitate communication or at least one person with language difficulties, some AAC are also used for vocalization from text or pictograms by people with speech difficulties.

Information technology — User interface component accessibility —

Part 40: Augmentative and alternative communication (AAC)

1 Scope

This document provides an introduction to and basic guidance on augmentative and alternative communication (AAC) in the information and communication technology (ICT) domain. It also provides common definitions and a framework for the development of further, more detailed guidance relating to aspects of these AACs.

This document recognizes that AAC can be delivered on various ICT devices and the importance of consistency for users across devices. It applies to AAC software and not the devices on which the software is used.

This document recognizes that AAC provides many users with a unique form of communication that is not necessarily based on any specific natural language.

2 Normative references

There are no normative references in this document.

3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

ISO and IEC maintain terminology databases for use in standardization at the following addresses:

- ISO Online browsing platform: available at <https://www.iso.org/obp>
- IEC Electropedia: available at <https://www.electropedia.org/>

3.1 augmentative and alternative communication AAC

assistive technology (3.2) that helps a person to communicate

Note 1 to entry: AAC can be used for face-to-face or remote communications between individuals or to provide communications with information technology (IT) applications.

Note 2 to entry: AAC can be used to express thoughts, needs, wants, questions, commands, and ideas.

Note 3 to entry: The AAC that this document deals with are computer-based.

3.2 assistive technology AT

equipment, product system, hardware, software or service that is used to increase, maintain or improve capabilities of individuals

Note 1 to entry: Assistive technology is an umbrella term that is broader than assistive products.
