## Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO document should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see [www.iso.org/directives](http://www.iso.org/directives)).

ISO draws attention to the possibility that the implementation of this document may involve the use of (a) patent(s). ISO takes no position concerning the evidence, validity or applicability of any claimed patent rights in respect thereof. As of the date of publication of this document, ISO had not received notice of (a) patent(s) which may be required to implement this document. However, implementers are cautioned that this may not represent the latest information, which may be obtained from the patent database available at [www.iso.org/patents](http://www.iso.org/patents). ISO shall not be held responsible for identifying any or all such patent rights.

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see [www.iso.org/iso/foreword.html](http://www.iso.org/iso/foreword.html).

This document was prepared by Technical Committee ISO/TC 204, *Intelligent transport systems*.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at [www.iso.org/members.html](http://www.iso.org/members.html).

# Introduction

## 0.1 Background

With the integration of core technologies from the Fourth Industrial Revolution—such as Artificial Intelligence (AI) and big data—along with advancements in streetlighting systems, the development and deployment of smart streetlighting platforms that deliver comprehensive information related to traffic, safety, and the environment are spreading rapidly.

The smart streetlighting management platform (SSMP) is a system in which detection devices—such as closed-circuit television (CCTV) cameras and radar sensors—are installed on roadside streetlights to collect and analyse real-time environmental data. Based on this analysis, the platform provides a range of services, including accident risk alerts, pedestrian safety support, identification of illegally parked or stopped vehicles, and relocation warnings.

For instance, when a pedestrian is crossing at a crosswalk under a flashing green signal and a speeding vehicle is detected approaching the area, the SSMP activates a variable message sign (VMS) and gobo lighting to issue a visual warning to the driver. Simultaneously, an audible alert is broadcast via speakers to inform pedestrians of the approaching vehicle, thereby prompting a swift and safe retreat to the sidewalk.

This document introduces the concept of the SSMP. While the technical content reflects an initial Korean implementation, the purpose of this document is to provide illustrative reference information that can be adapted and applied by other countries and regions considering the adoption of similar platforms, thereby ensuring global relevance.

## 0.2 Overview

This document introduces the SSMP, developed and implemented in Korea, presented here as a representative case study. While the content reflects the Korean implementation, it is intended as an illustrative, not prescriptive, reference to support international stakeholders planning to establish similar systems and to ensure adaptability across diverse national contexts. It presents general information, system components, and representative use cases of the platform.

The general information section outlines the SSMP's purpose and provides an overview of key service areas—such as crosswalks, crossroads, school zones, tunnels, and bridges—along with methods for delivering safety information, including alerts, warnings, and guidance.

The system components section details the platform's components and core functions, which are categorized into the central platform, local platform, intelligent edge units, and smart streetlighting.

The use case section describes each service provided by the SSMP and explains interactions between its various components. These use cases are based on the Korean implementation and are presented as illustrative examples, not prescriptive requirements, intended to support international understanding and potential adaptation in diverse regional contexts. [Annex A](#) provides data definitions established during the development and operation of the SSMP in Korea. In addition, a comparative table is included to support the adoption and operation of SSMP in different national contexts, aligning the data used in Korea with international standards such as National Transportation Communications for Intelligent Transportation Systems (NTCIP) standards and European Telecommunications Standards Institute (ETSI) standards. The comparative information is provided for reference purposes only, without reproducing normative content from those standards, thereby supporting interoperability and facilitating adaptation in global contexts.

## 0.3 Document approach and layout

This document specifies the following:

- a) General information regarding SSMP ([Clause 5](#)).
- b) System components of SSMP ([Clause 6](#)).
- c) Use cases of SSMP ([Clause 7](#)).

d) Comparison of data between Korea, NTCIP, and ETSI ([Annex A](#)).

The data exchange message comparison table among Korea, NTCIP, and ETSI is available electronically at <https://standards.iso.org/iso/tr/19482/ed-1/en>.

# Intelligent transport systems — Smart streetlighting management platform for road traffic safety enhancement — Overview and use cases

## 1 Scope

This document establishes the smart streetlighting management platform (SSMP) as a representative case study, based on the Korean implementation. This document provides practical, non-normative reference information to support other countries considering the adoption of similar systems.

This document provides information on:

- the system components of SSMP, the roles and functions of each individual component;
- the classification, naming, descriptions, and operational procedures of traffic safety service use cases enabled by SSMP.

## 2 Normative references

There are no normative references in this document.

## 3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

ISO and IEC maintain terminology databases for use in standardization at the following addresses:

- ISO Online browsing platform: available at <https://www.iso.org/obp>
- IEC Electropedia: available at <https://www.electropedia.org/>

### 3.1

#### **smart streetlighting management platform**

##### **SSMP**

platform that manages smart streetlighting to enhance traffic safety

Note 1 to entry: The SSMP is typically installed on roadside streetlights and can comprise a centre platform, local platforms, intelligent edge units (IEUs), sensor devices and information provision devices.

### 3.2

#### **centre platform**

platform that supervises and coordinates multiple local platforms

Note 1 to entry: The centre platform is usually installed at a traffic information centre.

### 3.3

#### **local platform**

platform that manages multiple intelligent edge units (IEUs)

Note 1 to entry: A local platform can generate response information for detected events.
